```

Challenges

Slow printing speed.

Small printing area.

Danit Peleg spent about 2,000 hours printing her collection, and Julia Daviy 6 months.

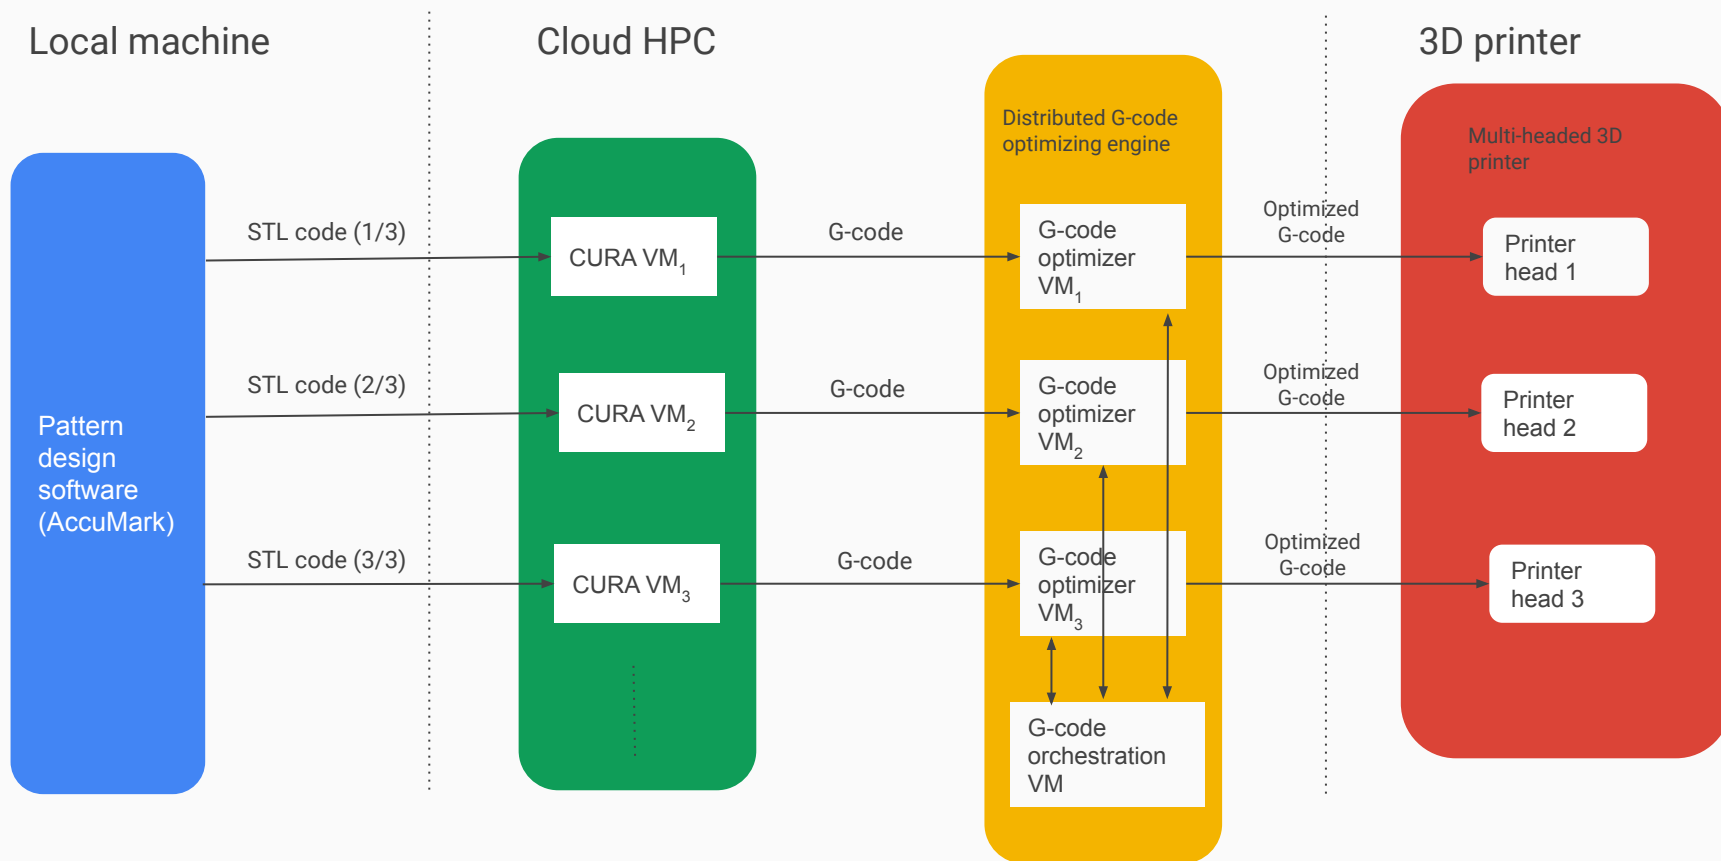

Possible solution

- Multi-headed printer
- HPC cloud

AutoDesk's Project Escher can have an (endless) amount of 3D print heads to create larger objects.

Parallel printing process

Optimization step 1/2

Movement of single head:

$$h_m = f_m(A); m = 1, \dots, M$$

Total distance per head:

$$H_m = \sum_{i=1}^{N_m} h_m$$

Total number of printed points by all heads is:

$$N = N_1 + N_2 + \dots + N_m$$

Distributing load across all heads:

$$\text{minimize}(H_m) \text{ w.r.t. } N_1 = N_2 = N_3 \dots = N_m$$

Optimization step 2/2

Number of computational steps

$$\text{NCS} = K_m^{N_m}$$

Number of communications between tasks:

$$\text{NC} = M!$$

$$\text{NCS} \gg \text{NC}$$

Conclusion

- 3D printing is a slow process
- Possibility of multi-headed printing (with long pre-processing time)
- Pre-processing can be done in parallel on HPC

Q&A
